

EXTEND THE LIFE OF YOUR CONCRETE

How does concrete leveling work?

After drilling a series of 1" holes, a high-density limestone grout is pressure-injected to fill the void.

Once the void is filled, the slab is stabilized and slowly raised to desired height.

The holes are then capped and the concrete is ready for immediate use.

What's below your concrete?

Over time water seepage, faulty drainage, poor compaction, and the freeze-thaw cycle result in settling which affects your concrete's base, resulting in a void.

What makes concrete-leveling green?

It eliminates unnecessary and costly concrete production and is an alternative to concrete replacement. We replace earth with more stable earth.

BENEFITS

- LIFTING CONCRETE CREATES SAFE WALKING ENVIRONMENTS
- TYPICALLY SAVES 50% OR MORE VERSUS CONCRETE REPLACEMENT
- PROTECTS AGAINST FUTURE DAMAGE
- NO WAITING—SAME DAY USE

OUR CLIENTS

- MUNICIPALITIES
- PROPERTY MANAGERS
- INDUSTRIAL FACILITIES
- RESIDENTIAL AND COMMERCIAL CLIENTS
- LOCAL, STATE, AND NATIONAL GOVERNMENTS

A-1 CONCRETE LEVELING
